## ABOUT THE URBAN INSTITUTE

The nonprofit Urban Institute is dedicated to elevating the debate on social and economic policy. For nearly five decades, Urban scholars have conducted research and offered evidence-based solutions that improve lives and strengthen communities across a rapidly urbanizing world. Their objective research helps expand opportunities for all, reduce hardship among the most vulnerable, and strengthen the effectiveness of the public sector.

## Acknowledgments

The Urban Institute's Housing Finance Policy Center (HFPC) was launched with generous support at the leadership level from the Citi Foundation and the John D. and Catherine T. MacArthur Foundation. Additional support was provided by the Ford Foundation and the Open Society Foundations.

Ongoing support for HFPC is also provided by the Housing Finance Council, a group of firms and individuals supporting high-quality independent research that informs evidence-based policy development. Funds raised through the Housing Finance Council provide flexible resources, allowing HFPC to anticipate and respond to emerging policy issues with timely analysis. This funding supports HFPC's research, outreach and engagement, and general operating activities.

This report was funded by these combined sources. We are grateful to them and to all our funders, who make it possible for Urban to advance its mission.

The views expressed are those of the authors and should not be attributed to the Urban Institute, its trustees, or its funders. Funders do not determine our research findings or the insights and recommendations of our experts. Further information on the Urban Institute's funding principles is available at www.urban.org/support.

## Americans' Debt Styles by Age and over Time

This research report, the first in a series, reviews five years of consumer credit data to better understand the debt styles of American consumers: how those styles differ for different age groups, and how those styles have evolved. Subsequent reports will explore other aspects of the data, as well as raise, and attempt to answer, some questions about why the data look as they do.

Our data consist of a random 2 percent sample of five years of depersonalized consumer data (2010-2014) from a major credit bureau. Consumers were chosen based on the last two digits of their personal identification number (assigned by the credit bureau for internal use). This generated a total of 5.314 million consumers for the August 2010 draw. The same information for each consumer was collected each August from 2010 through 2014, creating panel data with five snapshots for each consumer in the panel. If a consumer dropped out of the data (for example, because he or she passed away), a new consumer was added in a manner that retains randomness in the sample. All records were stripped of personally identifiable information, and no data on race/ethnicity, gender, or income were included. The data included zip code, age, ${ }^{1}$ Vantage score, ${ }^{2}$ information on debt in collection, and balance and payment information for each of the following trade types: auto loan, credit card, student loan, home equity line of credit, first mortgage, and second mortgage.

Test how much you know about consumer debt by taking our quiz on the next page.

## Debt Style Pop Quiz

Q1: What kind of consumer debt do most Americans carry?
a. No debt
b. Credit card only
c. Credit card and mortgage
d. Credit card and auto
e. Student loan and auto

Q2: At what age are borrowers most likely to have auto debt?
a. 20 s and 30 s
b. 30 s and 40 s
c. 40 s and 50 s
d. 50 s and 60 s
e. 60s and up

Q3: Which types of debt have grown from 2010 to 2014?
a. Student and auto loans
b. Mortgages and home equity lines of credit (HELOCs)
c. Credit cards for younger households
d. $a$ and b
e. a and c

Q4: The borrower groups with the lowest credit scores are those with what kind(s) of debt?
a. No debt
b. Auto loans only
c. Auto loans and credit cards
d. Auto and student loans
e. Auto loans, credit cards, mortgages, HELOCs, and student loans

Q5: Those with mortgage debt typically have less mortgage debt than other Americans if they have
a. Only mortgage debt
b. Mortgages and auto loans
c. Mortgages and HELOCs
d. Mortgages, auto loans, and HELOCs
e. Mortgages, auto loans, and student loans

Answers: Q1: a (followed by b); Q2: b; Q3: e; Q4: a (followed by b); Q5: a.

If you answered all five questions correctly, you don't have to read this paper; you should have helped us write it. If you answered four questions correctly, you are a very astute observer of the debt scene and you may or may not benefit from reading on. If you answered three or fewer questions correctly, we promise you will learn something if you keep reading.

## Age Patterns of All Debts

## Middle-Aged Consumers Bear the Highest Debt Burden

Those without debt tend to be quite young: approximately 54.5 percent of consumers ages 18-22 are debt free, as are 39.2 percent of those between 23 and 27 (figure 1 A ). ${ }^{3}$ The percentage of borrowers with no debt drops steadily as borrowers age, falling to 18.1 percent for the 63-67 age group, after which it rises again, reaching 36.1 percent for those older than $77 .{ }^{4}$ And balances follow a similar pattern. Figure 2A shows that, for those with debt, the debt burden is lowest for the very young and the very old, peaking for borrowers between ages 38 and 52.

Figure 1A shows five trend lines, one for each year between 2010 and 2014. For consumers younger than 48 years old, the percentage without debt of any kind has dropped steadily; as the economy has improved, consumers have been comfortable increasing their leverage.

Figure 3A (page 9) shows the median 2014 credit scores of all consumers with and without debt. Our analysis reveals that, within each age cohort, those without debt tend to have much lower Vantage scores. For example, the 39.2 percent of 23-27-year-olds with no debt have a median Vantage score of 524 , versus 669 for those who have debt. This difference is a bit narrower for older consumers, but still quite dramatic. Those over age 77 who have no debt have a median Vantage score of 675, versus 805 for consumers with debt. This suggests that those who have no debt have not built the credit history necessary to obtain debt, rather than the alternative, that they have no need for debt. Across age groups, younger consumers tend to have much lower credit scores than older consumers. For example, the median Vantage score for consumers 30 or younger is no more than 650; but it is more than 780 for consumers 68 or older.

## Debt Patterns and the Life-Cycle Model of Consumption

The result that the debt burden is lowest for the youngest and oldest age group is somewhat at odds with the economic literature on the life-cycle model of consumption. The model suggests that a consumer's level of consumption should be proportional to average lifetime income rather than actual income at any given age (Friedman 1956; Hall 1978; Modigliani and Brumberg 1954). That is, younger age groups theoretically consume more than their income, but as their income rises through the years, their consumption won't rise proportionately. Instead, much of the rising income is saved for retirement. During retirement, while income is low, people maintain their lifestyle by living off their savings.

We are not the first to show that this pattern does not hold. We support the conclusion of a number of earlier empirical studies that consumer's actual choices differ from those of the life-cycle model of consumption in a number of ways: First, consumers tend to borrow and consume less than predicted early in their lifetimes. Second, they also tend to consume more and save less than predicted in middle age, when they have their highest earnings; consequently they do not have enough savings to maintain their consumption levels in retirement (Bernanke 1984; Carroll 1997; Flavin 1981; Hall and Mishkin 1982; Mankiw and Shapiro 1985; Shapiro and Slemrod 2003; Souleles 1999; Stephens 2003).

Further, younger consumers tend to have lower credit scores than older consumers; and, within an age group, borrowers with no debt have lower credit scores than those with debt. Both facts support the earlier conclusion of Wilcox (1989) and Zeldes (1989): consumers avoid debt because they are constrained on what they can borrow and how much it costs, rather than because they have no need for debt.

Apart from this report, little in the literature demonstrates how the type and the amount of debt, as well as consumers credit scores by debt styles, change across age groups.

## Age Patterns of Five Major Types of Debts

## Debt Types by Age Groups

In 2014, the percentage of consumers with credit card spending ${ }^{5}$ ( 61 percent) exceeded the percentage of consumers with any other type of debt. The next largest debt category was auto loans (29 percent), then mortgages (28 percent), then student loans (11 percent), then HELOCs (6 percent).

Distinctive age patterns are associated with each debt type. Figure 2 shows that the percentage of consumers with each of the five major types of debt follows an inverted $U$ shape, rising and then falling again as consumers move to older age groups. However, the curve for each type of debt peaks at a different age cohort and with different smoothness and symmetry. The highest percentage of consumers have credit card debt in their 30s through early 70s (figure 1B), student loan debt in their 20 s and 30 s (figure 1C), auto debt in their 30s through 50s (figure 1D), mortgage debt in their late 30s through early 60s (figure 1E), and HELOC debt in their early 40s through late 60s (figure 1F).

These debt patterns reflect lifestyle changes as consumers get older: they finish their higher education and largely pay off the associated debt in their 20 s and 30 s, finance and become auto and homeowners in their 30s through their 60s, and accumulate enough equity on their homes to finance other spending against that equity in their late 40s through late 60s.

Unfortunately, our numbers for credit card debt do not allow us to differentiate between those who use credit cards as a transaction vehicle, paying off their bills each month, and those who use credit cards as a credit vehicle to finance their purchases over time. ${ }^{6}$ We can see, however, that 40 percent of consumers in their early 20 s have credit card spending, increasing steadily to 75 percent of consumers in their 60s and then falling again into their 70s and beyond (figure 1B).

Excluding credit card spending, the percentage of consumers without any auto, mortgage, HELOC, or student debt follows a more symmetric Ushape: 80 percent of consumers in their early 20 s do not have these types of debt. This share of consumers quickly falls to only 40 percent in their late 30 s through late 50s, but rises again to more than 70 percent in their late 60 s and older (figure 4).

## Amount of Debt by Debt Type and Age Groups

As shown in figure 2A, consumers' median total debt balance rises from $\$ 10,000$ in their mid-20s to $\$ 65,000$ in their late 30 s through early 50 s, then falls again as they move to older age cohorts.

While the general inverted-Uage patterns apply to the median balance for each type of debt, there are distinct differences among the debt types. Consumers with auto loans have the highest debt burden in from their late 30s to their 40s (\$14,000, figure 2D); consumers with mortgage debt are most burdened in their 30s and 40s (\$160,000, figure 2E); and consumers with HELOCs owe the most in their late 40 s ( $\$ 36,000$, figure $2 F)$. The amount of student debt peaks from the 30 s to the early 40 s $(\$ 15,000$, figure 2 C ), an older age than the peak percentage of consumers who have student loans, perhaps reflecting higher student debt for those attending professional schools (Baum and Johnson 2015). Note
that figure 1B showed us that consumers are most likely to have credit card spending in their late 60s. However, this does not correspond to amount of credit card spending or debt; consumers in their 40s and 50 s with credit card spending carry higher credit card balances ( $\$ 3,800$ monthly) than other groups (figure 2B).

The percentage of auto and student loan borrowers has grown from 2010 to 2014, as have the balances of these debt types (figures 1C, 1D, 2C, and 2D; table B.3). For example, 32 percent of consumers in their 30s and 40s had auto loans in 2010, rising to 35 percent in 2014; auto debt balances for this cohort rose from $\$ 13,000$ in 2010 to $\$ 15,000$ in 2014 . Similarly, 20 percent of consumers in their 20 s had student loans in 2010, rising to 23 percent in 2014; student debt balances for this cohort rose from \$12,000 in 2010 to \$14,000 in 2014.

By contrast, the percentage of consumers with mortgage debt and HELOC debt has fallen, particularly for HELOC debt (figures 1E, 1F; table B.2). The proportion of consumers holding mortgage debt for the peak age cohort-late 40s-has declined from 43 percent in 2010 to 39 percent in 2014. This parallels the steady decline in the homeownership rate. However, for borrowers with mortgages, the median debt balance has risen from \$150,000 in 2010 to \$160,000 in 2014.

We find 12.5 percent of consumers in their 50 s held HELOC debt in 2010, falling to 9.5 percent in 2014; their median HELOC balance fell from $\$ 38,000$ in 2010 to $\$ 37,000$ in 2014. The declining percentage of consumers with HELOCs most likely reflects a combination of pay-downs, foreclosures, and extremely tight credit following the financial crisis.

The percentage of consumers with credit card debt has grown from 2010 to 2014 for younger age groups (those under 48), but balances have remained largely static (figures 1B and 2B). However, for older age groups, the percentage with debt has been largely stagnant but average credit card balances have risen. For example, for consumers ages 63 to 67 there has been an increase from $\$ 2,300$ in 2010 to \$2,700 in 2014.

## Consumers' Credit Scores and Debt Types

Older consumers tend to have higher credit scores than younger consumers. The median 2014 Vantage score for consumers in their 20s is 630 ; this number rises to more than 760 for consumers in their 60 s and 70s (figure 3A and table B.4).

Within each age cohort, consumers with credit card spending have much higher median credit scores than those without, with an average 160-point gap over all age groups. While the relationship is quite strong, the causality is unclear. It is possible that those with credit card spending were those with credit scores high enough to get cards. It is also possible that responsible use of cards increased their credit scores. While the gap is largest for the youngest age groups and declines with age, the median Vantage score for consumers in their 70s with credit card spending is still 80 points higher than the score for those without (figure 3B, table B.4).

For consumers younger than their mid-60s, median credit scores are higher for consumers with mortgage debt than for those without-undoubtedly, in part, reflecting the difficulty those with low scores have in getting a mortgage. The largest gap-130 points-occurs in the late 20 s and 30 s , as holding a mortgage likely also reflects increased stability and, of course, the transition from renter to owner (figure 3E). This gap grows narrower as consumers age, and disappears when consumers reach their mid-60s, when many of those who had mortgages have paid them off. For those in their late 60s and older, consumers who still have mortgages actually tend to have lower credit scores than those who don't.

For those with student loans, borrowers in their late $30 \mathrm{~s}, 40 \mathrm{~s}$, and older have lower credit scores than borrowers with no student loans (figure 3C); for auto loans, borrowers in their late 50s and older have lower credit scores than those without auto debt (figure 3D); and for HELOCs, borrowers in their early 70s and older have credit scores than those without the debt (figure 3F). We believe this crossover point reflects the age when many of the most creditworthy customers have paid off the debt in question.

## Debt Styles: Combinations of Different Types of Debts

## 17 Debt Styles

Each of the five major types of debt reflects a different aspect of consumers' lifestyle needs. For a complete picture of a consumer's debt style, we have to look at what combinations of debts the consumer carries at any given time. The consumer may have any combination of auto, mortgage, HELOC, or student loan debt. That gives us 16 combinations; adding borrowers with only credit card balances gives us 17 debt styles. The 10 most popular combinations are shown in figure 4 (see table B. 1 for a full list of all 17 debt styles). For our analysis, we have not paired credit card debt with other debt, as we cannot distinguish transaction balances from revolving balances.

The top six debt styles among consumers with a credit record, in descending order, are

1. no debt ( 29 percent of all consumers),
2. credit card spending only ( 22 percent),
3. mortgage only (13 percent),
4. auto loan only (12 percent),
5. auto and mortgage ( 9 percent), and
6. student loan only (4 percent).

However, this rank order is not constant once we divide consumers into age groups. Rankings within age groups reveal distinct patterns of debt styles, reflecting consumers' lifestyle changes over time.

## Debt Styles by Age Groups

Except for the "no debt" and "credit card only" styles, which have a Ushape, debt styles over age follow an inverted $U$ shape, first rising and then falling as consumers move to older age groups. Figure 4 shows age patterns for each debt style.

FIGURE 4
Percentage of Consumers Adopting a Debt Style, by Age Cohort

Source: Authors' calculations.

1. The "no debt" and "credit card only" debt styles dominate the oldest ( 82 percent) and youngest age groups ( 80 percent). In the middle age groups, consumers are more likely to have something other than just credit card debt: 60 percent of consumers in their 40 s and 50 s have at least one auto loan, student loan, mortgage, or HELOC.
2. The "mortgage debt only" style hits its high mark of 16-19 percent when consumers are in their late 30 s through early 60 s , while the "mortgage and HELOC together" debt styles are most common for those in their 40s through mid-60s (4-5 percent).
3. The "auto loan only" style hits its high mark of 15 percent for consumers in their 20 s , but at least 10 percent of all consumers in each age cohort under 73 have an auto loan.
4. The "auto and mortgage debt together" combination hits its high mark of 13 percent with consumers in their late 30s through early 50s.
5. The "student loans only" and "student loans plus auto together" styles hits their high-water marks of 7-12 percent and 5-6 percent, respectively, for consumers in their 20s and decline quickly after the mid-30s.

In summary, for the 18 to 27 age group, the top three debt styles are "auto only," "student loan only," and "both auto and student loans"; for the 28 to 32 age group, the top three debt styles are "auto only," "student only," and "mortgage only"; for borrowers over age 32, the top three are "mortgage only," "auto loan only," and "both auto and mortgage loans."

For a closer and deeper look at age patterns of the debt styles and the interrelationship between different types of debts, see appendix A.

## Conclusion

In this paper, we have looked at debt styles across age groups. The basic patterns are not surprising: student loan debt is more popular among younger borrowers; mortgages are more popular among borrowers in their 30, 40s, and 50s. Home equity and "credit card only" debt is more prevalent among older adults. Vantage scores generally rise with age. Those with mortgage debt in the mix have the highest total indebtedness.

But there are a number of surprises: Consumers who have no debt have weaker credit scores than those who have debt. Consumers who have auto debt in combination with any other type of debt generally have lower credit scores than those who do not have auto debt but do have other debt. Borrowers in their 20s and early 30s with both mortgage and student loan debt have higher credit scores than borrowers in their later 30s and 40s with the same combination. Those borrowers who hold
only any one type of debt (autos, mortgages, HELOCs, credit cards) generally hold less of that type of debt than those who use that debt in combination.

We also find that consumers' actual debt patterns differ from the predictions of the life-cycle model of consumption, which can be explained by the constraints on what borrowers can borrow at what cost, rather than they have no need for debt.

## Appendix A: A Closer Look at Debt Styles by Individual Debt Types

Debt styles are combinations of different types of debts. This section discusses relevant debt styles by each major debt type separately, by looking at how consumers combine a type of debt with other debt types, and how the balance on that debt differs by age cohort among different combinations. One consistent pattern is that those who have only one type of debt tend to have less of that debt than those who have that type of debt in combination with other types of debt.

One important note: for credit cards, we cannot differentiate between consumers who use their credit cards for transactional purposes and consumers who carry a revolving balance. Hence, we did not consider credit cards when discussing debt styles under each of the auto, mortgage, HELOC, and student loan sections. Instead, the last section of this appendix is devoted to "credit card only" debt and credit cards in combination with other types of debt.

Figures in appendix A are broken down to allow us to look more closely at consumers who have each debt type by debt style and age.

## Auto Debt

Figure A. 1 A shows the percentage of consumers with auto loans by age group, the same picture seen in figure 1D. For consumers in their 20s, approximately 25 percent have auto debt (figure A.1A): 14 percent have auto debt only (figure A.1B), another 6 percent have auto debt plus student loans (figure A.1C), and 3 percent have auto, and student loan debt (figure A.1D); the balance have other combinations. For consumers in their 40 s , almost 40 percent have auto debt: 11 percent have auto debt only, 12.5 percent have auto and mortgage debt, 3 percent have auto, mortgage, and HELOC debt, and the balance have other combinations.

Figure A.2A shows the median balance for those who have auto debt by debt style. Those who have auto debt only have lower amounts of auto debt than those who have auto debt in combination with other debt types. Borrowers who have auto debt plus mortgage debt tend to have higher amounts of auto debt than borrowers that do not have mortgage debt. This becomes clear when comparing line 2 (auto only) to line 3 (auto + mortgage) and line 5 (auto + mortgage + HELOC), or by comparing line 4 (auto + student loan) to line 6 (auto + mortgage + student loan).

FIGURE A. 1
Debt Styles of Consumers with Auto Loans, by Age Cohort

Source: Authors' calculations.

Figure A .2 B shows that for all but the very oldest age groups, borrowers who have auto debt and auto plus student loan debt (lines 2 and 4) also have lower Vantage scores than borrowers who have auto debt in combination with mortgage debt (lines 3, 5, and 6).

FIGURE A. 2

B. Median Vantage score

Source: Authors' calculations.
Note: Line 2 is auto only, line 3 is auto + mortgage, line 4 is auto + student loan, line 5 is auto + mortgage + HELOC, and line 6 is auto + mortgage + student loan.

## Mortgage Debt

Few borrowers have mortgage debt in their 20s. By their late $40 \mathrm{~s}, 40$ percent have mortgage debt (figure A.3). As with auto debt, those who have mortgage debt alone have less average mortgage debt than those who have mortgage debt as well as another type of debt (figure A.4A). Consumers who also have HELOC debt have the highest amounts of mortgage debt. Consumers with mortgage debt only have higher credit scores than those who hold mortgage debt and other debt (figure A.4B).

While credit scores generally increase with age, consumers who have mortgage debt, auto debt, and student loan debt in their 20s and early 30s tend to have higher credit scores than those who have that combination by their late 30s and after (figure A.4B). One explanation: mortgage debt is relatively uncommon in one's 20 s and early 30 s, so perhaps those who have this debt at this age have higher incomes and better credit scores in general. Borrowers with auto debt in any combination with mortgage debt have lower credit scores than those who have no auto debt.

Note: Line 2 is mortgage only, line 3 is mortgage + auto, line 4 is mortgage + HELOC, line 5 is mortgage + auto + HELOC, and line 6 is mortgage + auto + student loan.

## HELOC Debt

HELOC debt is most commonly found as the only form of debt, or in combination with mortgage debt or mortgage and auto debt (figure A.5). Other combinations are relatively rare. We had noted earlier in the paper that HELOC debt is skewed to older borrowers, but borrowers who only have HELOC debt are even older. Those who have HELOC and mortgage debt or HELOC and mortgage and auto debt are somewhat younger.

Borrowers older than their mid-50s with HELOC debt have less HELOC debt if they have only HELOC debt or HELOC and auto debt than borrowers whose debt style includes mortgage debt in any form (figure A.6A). This pattern is reversed for younger borrowers: those who hold HELOC only or HELOC and auto debt have more HELOC debt than those who hold the HELOC debt in any combination with mortgage debt. Further investigation is necessary to determine the reason for this.

Credit scores for those with HELOC debt are quite high across the board (figure A.6B). Older borrowers with HELOC debt or HELOC debt and auto debt have the highest scores. For younger borrowers with HELOCs, credit scores are fairly constant across debt styles. The only exception is that younger borrowers (under 50) who have both HELOC and auto debt have lower scores than other debt styles with HELOC debt.

## Student Loan Debt

Twenty-one percent of younger consumers have student loan debt, and approximately half of these have student loan debt only (figure A.7). The median amount of student loan debt does not vary much by debt style. Borrowers who have student loan debt only generally have slightly less student loan debt than those that have student loan debt in combination with other debt (figure A.8A). Consumers in their $30 \mathrm{~s}, 40 \mathrm{~s}$, and 50 s with student loan debt and mortgage debt, with or without auto debt, tend to have the highest amount of student loan debt of any debt style, suggesting that many have accumulated debt through graduate school. Consumers with only student loan debt tend to have lower credit scores than any other group. Those consumers who have mortgage debt in the mix have the highest credit scores (figure A.8B).

Note: Line 2 is student only, line 3 is student + auto, line 4 is student + auto + mortgage, and line 5 is student + mortgage.

## Credit Card Debt

Consumers with credit card debt range from 40 percent of younger borrowers to over 70 percent of borrowers in their late 50s and early 70s (figure A.9A). Not surprisingly, the percentage of "credit card only" borrowers is Ushaped-higher for younger borrowers, reaching a low of 15 percent for those in the 30 s and 40 s, then beginning to rise again, reaching over 40 percent by the early 70s (figure A.9B). "Credit card and mortgage debt" and "credit card and mortgage and auto debt" have an inverted $U$ shape, with peaks for consumers in their 30s, 40s, and early 50s (figures A.9C and A.9D). Credit card and auto debt is relatively constant across age groups from the mid-20s to the mid-70s, ranging from 7 to 9 percent of the total (figure A.9E). Credit card and student loan debt is, as would be expected, far more prevalent among younger age groups (figure A.9F).

Credit card balances are lowest for those with only credit card debt and highest among consumers with credit card, mortgage, and auto debt (figure A.10A). When mortgage debt is found in the mix, in any form, credit card balances are higher than when it is not. We cannot tell whether these borrowers are more apt to be carrying revolving balances or whether they are simply more affluent, so their transactions balances are higher.

Consumers younger than mid-30s with credit card and auto debt have lower credit scores than other consumers (figure A.10B). For consumers older than this, those with credit card and student loan
debt have the lowest scores. For borrowers younger than mid-50s, those with mortgage debt have the highest credit scores. Borrowers older than this with only credit card debt have the highest scores.

## FIGURE A. 9

## Debt Styles of Consumers with Credit Card Debt, by Age Group

## C. Percentage with credit card debt + mortgage

E. Percentage with credit card debt+auto

Source: Authors' calculations.
B. Percentage with credit card debt only

D. Percentage with credit card debt + mortgage + auto

F. Percentage with credit card debt+student

FIGURE A. 10

## Notes

1. Consumers' ages are reported separately for each yearly 2010-2014 sampling period. Twenty-four percent of consumers have no age information at all for the entire five sampling periods; 98.9 percent of those consumers who do not have age information either have no debt ( 88.1 percent, see table B.1) or only have credit card spending ( 10.8 percent, see table B.1). For consumers who do have age information, the vast majority ( 94 percent) have consistent age over the five consecutive annual sampling points. For the rest of consumers without consistent age information ( 6 percent), we calculate the median age over the five sampling points for each consumer, and assign the median age as the age of the consumer in 2012; for the other four sampling periods, the consumer's age is assigned to make it consistent over time.
2. Lenders rely extensively upon two scoring models in making credit decisions, Vantage score and FICO. Vantage score is a credit score derived from consumer credit information. It is jointly owned by the big three credit bureaus-Experian, Equifax, and TransUnion, who all contribute their data. Vantage 3.0, used in our analysis, was introduced in March 2013 and is able to calculate a score for an additional 30 to 35 million previously "unscoreable" consumers. Consumers receive a score within the range of 300-850. This is the same scale used by FICO.
3. Consumers with zero balance on all open trades reported in the last six months of a sampling period are considered as consumers without any debt for that sampling period. We use the same definition to define whether a consumer has debt for a specific type of trade, such as credit card debt, an auto loan, a student loan, a home equity line of credit, or a mortgage. For mortgage debt, the balance used is the combined balance on both a first and a second mortgage.
4. Readers should be aware that major credit bureaus will only have data on consumers with either credit of the types included by the credit bureau or collections activity, such as medical bills, utility bills, or government debt. Thus, our numbers will likely understate the percentage of those who have no debt, as many consumers with no debt have no credit history and no items in collection, and hence there is no record of the consumer at any of the three major credit bureaus.
5. We use the term "credit card spending," because our data on credit card debt do not distinguish between those who pay off their credit cards each month and those who carry over a balance.
6. There is no consensus on the percentage of borrowers who pay their balances in full. An American Bankers Association "Credit Card Monitor," released in December 2014 and covering Q2 2014, found that 29.0 percent of borrowers pay in full each month, 29.8 percent are dormant accounts that showed no activity over the quarter, and 41.2 percent are revolvers in which some percentage of the monthly balance is rolled over to the next month at least once during the quarter (American Bankers Association, "Credit Card Market Monitor, December 2014,"December 16, 2014, http://www.aba.com/Press/Documents/12.16.14ABACreditCardMonitorFAQ.pdf).

In our analysis, a dormant account with a zero balance would be picked up as no credit card debt. If we rescaled, assuming all dormant accounts are zero balance, it would suggest of those with credit card debt, 41 percent pay off their balances in full each month. A Gallup poll survey, done in April of 2014, found that 48 percent of borrowers said they always paid the full amount of their credit card balances each month, and another 16 percent said they usually did. Another 20 percent said they usually left balances, 12 percent usually paid the minimum, and 1 percent paid less than the minimum (Art Swift, "Americans Rely Less on Credit Cards Than in Previous Years,"Gallup.com, April 25, 2014, http://www.gallup.com/poll/168668/americans-rely-less-credit-cards-previous-years.aspx). A Bankrate.com survey in August 2014, found that 40 percent of borrowers under 30 said they paid off their cards each month, versus 53 percent of those 30 and older (Jeanine Skowronski, "More Millennials Say 'No' to Credit Cards," Millennials and Money (blog), Bankrate.com, September 8, 2014, http://www.bankrate.com/finance/credit-cards/more-millennials-say-no-to-credit-cards1.aspx.)

## About the Authors

Wei Li is a senior research associate in the Housing Finance Policy Center at the Urban Institute, where his research focuses on the social and political aspects of the housing finance market and their implications for urban policy. His research has led to the creation of the popular Credit Availability Index (HCAI) and the Real Denial Rate. He is the winner of the 2015 Urban Institute President's Award on Outstanding Research. His work has been published widely in various academic journals and has been covered in the Wall Street Journal, the Washington Post, and the New York Times, as well as in other print and broadcast media. He is also a quantitative research methodologist with a deep understanding of cost-benefit analysis, program evaluation, and causal inference in social and political science.

Before joining Urban, Li was a principal researcher with the Center for Responsible Lending, where he wrote numerous publications on the housing finance market and created and managed the nonprofit organization's comprehensive residential mortgage database. Li received his PhD in environmental science, policy, and management and an MA in statistics from the University of California at Berkeley.

Laurie Goodman is the director of the Housing Finance Policy Center at the Urban Institute. The center is dedicated to providing policymakers data-driven analyses of housing finance policy issues that they can depend on for relevance, accuracy, and independence.

Before joining Urban in 2013, Goodman spent 30 years as an analyst and research department manager at a number of Wall Street firms. From 2008 to 2013, she was a senior managing director at Amherst Securities Group, LP, a boutique broker/dealer specializing in securitized products, where her strategy effort became known for its analysis of housing policy issues. From 1993 to 2008, Goodman was head of global fixed income research and manager of US securitized products research at UBS and predecessor firms, which were ranked first by Institutional Investorfor 11 straight years. Before that, she was a senior fixed income analyst, a mortgage portfolio manager, and a senior economist at the Federal Reserve Bank of New York.

Goodman was inducted into the Fixed Income Analysts Hall of Fame in 2009. She serves on the board of directors of MFA Financial, is an advisor to Amherst Capital Management, and is a member of the Bipartisan Policy Center's Housing Commission, the Federal Reserve Bank of New York's Financial Advisory Roundtable, and the New York State Mortgage Relief Incentive Fund Advisory Committee. She has published more than 200 journal articles and has coauthored and coedited five books. Goodman has a BA in mathematics from the University of Pennsylvania and an MA and a PhD in economics from Stanford University.

## STATEMENT OF INDEPENDENCE

The Urban Institute strives to meet the highest standards of integrity and quality in its research and analyses and in the evidence-based policy recommendations offered by its researchers and experts. We believe that operating consistent with the values of independence, rigor, and transparency is essential to maintaining those standards. As an organization, the Urban Institute does not take positions on issues, but it does empower and support its experts in sharing their own evidence-based views and policy recommendations that have been shaped by scholarship. Funders do not determine our research findings or the insights and recommendations of our experts. Urban scholars and experts are expected to be objective and follow the evidence wherever it may lead.
